

### AiM™ Key and Access Control

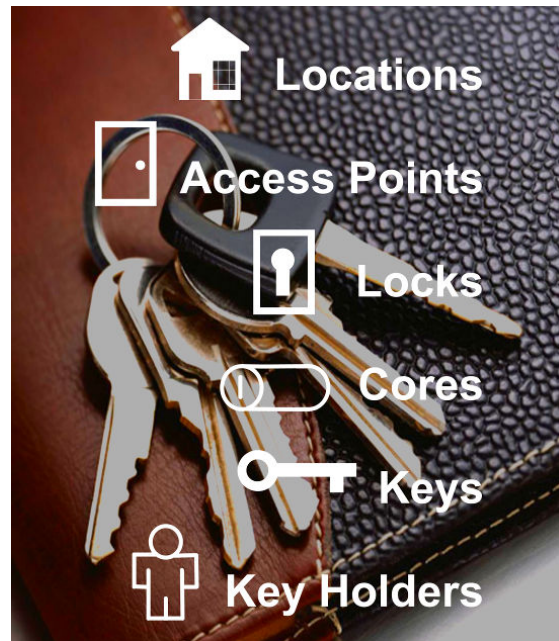

Key and Access Control management does not have to be difficult, but daily tasks associated with it can often be time consuming. The inability to track the number of keys issued and not knowing who has access to a particular access point is the source of much frustration.

The AiM Key and Access Control module provides a solution that increases security, saves time, and reduces costs. With this module, organizations can track and manage:

- Keys
- Key Rings
- Key Holders
- Locks
- Cores
- Access Points

This module is fully integrated to the AiM Work Management module and the Inventory Module to support a key shop scenario anywhere within the organization.

It also provides the ability to track the locations for stored and issued keys and cards, blank and cut status, and the costs associated with the materials used in the key making, lock installation, key card creation and activation, and any other cost the organization incurs to support this functionality.

The Key and Access Control Module supports the following industry standard hierarchy:

1. Access Points are defined and associated to locations
2. Locks are defined and associated with access points
3. Cores are defined and associated with locks
4. Keys are defined and then associated with cores
5. Key Holders are associated to keys
