AiM™ Key and Access Control

In large organizations, key and access control management can be a time-consuming chore, which belies its importance in the broader equation of enterprise security. The inability to track the number of keys issued or determine who has access to a given access point can be as dangerous as it is frustrating.

With AiM's Key and Access Control module, your organization can increase security, save valuable time and reduce costs simply by improving how you track and manage:

- Keys
- Key Rings
- Key Holders
- Locks
- Cores
- Access Points

The Key and Access Control module is fully integrated with AiM's Work Management and Inventory modules to support a key shop scenario anywhere in the enterprise. It also enables you to track the location of stored and issued keys and access cards, key blank and cut status, and the cost associated with materials used in key fabrication, lock installation, key card creation and

activation, and other costs incurred in support of access control.

AiM's Key and Access Control module also supports the following industry standard hierarchy:

- Access points are defined and associated to locations
- Locks are defined and associated with access points
- Cores are defined and associated with locks
- Keys are defined and associated with cores
- Key holders are associated to keys
