# AssetWORKS

APIs

Take control of your integrations

AssetWorks APIs allow customers to build their own integrations without relying upon external resources. With APIs, customers are fully responsible for building and maintaining integrations, providing a level of customization and independence required by modern fleet and asset management organizations. APIs will not affect existing interfaces and integrations.

The APIs available to customers include:

Work Order API – The Work Order API consists of asset and work order data and associated code sets.
- For assets, this includes: the asset itself, departments,asset/department assignments, asset/location assignments
- For work orders, this includes: incident/service requests, work orders and commercial work orders including jobs/tasks, parts, and labor

Financial API – The Financial API consists mainly of billing information and cost information related to the asset.

More APIs will be added based on customer usage and need. The AssetWorks team will continue to evaluate the release plan based on customer feedback and demand.

Do you need more flexibility with integrations?

Is your team able to maintain integrations independently?

To learn more about AssetWorks APIs, please contact your AssetWorks Sales representative or visit us online at assetworks.com.
