

AssetWORKS TELEMATICS CLOUD PLATFORM

The AssetWorks Telematics Cloud

platform allows your telematics vendor of choice to integrate into your instance of FleetFocus through the cloud environment. With Telematics Cloud, fleet managers have quick access to vehicle location data, as well as diagnostics and maintenance alerts, in one, integrated platform.

Examples of data points integrated into FleetFocus from your GPS/ Telematics provider may include emission status, engine oil pressure, battery voltage, engine coolant temperature, misfire information, run time, odometer readings, average fuel economy, and position data.

The platform allows for building adapters with 3rd party vendors to retrieve data from their system, as well as allowing vendors to push data to the FleetFocus API. With the platform being cloud-based, the AssetWorks team can scale more quickly and have improved failover protection for customers.

Key Features

- All telematics data available for FleetFocus-specific functionality, including notifications, reports, auto-generation of service requests, and trend analysis
- Single API for telematics data
- Simultaneous updates across both platforms
